papers on  
androgenital  
syndrome

Is working with Bill Horsfall on the Bathurst Island  
Intersexes (Hermaphrodites)

Of these all are related back to a single  
female (about 1870) whose brother was affected

The affected individuals are treated as females,  
though in at least one show male type behavior  
(in a girl's derivation). There is breast development  
at puberty but glands etc would be more male  
than female in appearance.

Horsfall finds the cases to be chimeric  
negative on buccal smears. Is now going to send  
blood & 24 hr urine to Horsfall for analysis
