

Notes in discussion with Mr Ted Milligan
Dandin 3/2/68.

Showed me Health Dept report on
Maxwell et al on 16 DWT measurements
for Pituhui Dwaiki ages from 0 - 15 yrs
Claimed that departure in the percentiles
from White Standards is indicative of
Malnutrition. Claims also that there is
no difference between Pituhui Dwaiki.

Milligan believed the report to be statistically
defective and that there is a significant
difference in the two tribes. Believed
also that comparison with White norms
is fallacious in absence of evidence
excluding a genetic effect.

Also showed a so-called prospective study
on 400 children in Arnhem Land by Sister
Kettle (Pub'd in J.A.) — Less than 100 children
1966
had been were measured in the first period at
60 months.
